

NIKLASON et al  
Appl. No. 10/074,250  
July 10, 2006

### REMARKS/ARGUMENTS

Reconsideration of this application is respectfully requested.

Claim 1 stands rejected under 35 USC 112, first paragraph, as allegedly lacking written description. The rejection is traversed for the reasons that follow.

In maintaining the rejection, the Examiner again makes reference to the fact that the recited active agents are functionally defined (inhibitors of vascular cell proliferation) and further that the definitions are broad and encompass yet to be identified inhibitors. The Examiner's position appears to be that the subject disclosure would not have conveyed to the reader that Applicants had full possession of the claimed invention at the filing date.

At the outset, the Examiner is reminded that the sufficiency of the written description provided must be viewed from the standpoint of one skilled in the art. As pointed out previously, the subject specification includes numerous examples of known agents that can be used in Applicants' novel methods. At page 7-10 of the application, a large number and wide variety of suitable agents are described. (Applicants also provide at pages 10-12 of the application methods of identifying yet further agents that would be suitable for use in the invention.) While these teachings are believed to be sufficient in and of themselves, the skilled reader would have appreciated that, as of February 2001, the art was replete with examples of agents as defined by the instant claims. Accordingly, there is absolutely no basis for the Examiner's assertion on page 3 of the Action that the only suitable agents taught are those of claim 11.

NIKLASON et al  
Appl. No. 10/074,250  
July 10, 2006

The Examiner again contends that the language of claim 1 is functional at the point of novelty and again refers to Lilly<sup>1</sup>. In that regard, attention is again directed to the fact that the present claims are drawn to a method of inhibiting or treating progression of cerebral vasospasm that follows SAH. The Examiner's assertions to the contrary, the novelty of the claimed method does not result from the specific nature of the agent used but rather from the fact that Applicants were the first to appreciate and disclose that narrowing of cerebral arteries that is characteristic of cerebral vasospasm is in fact due to proliferation of cells in the vascular wall and/or accumulation of extracellular matrix under the influence of growth factors. Accordingly, the claim is in no way functional at the point of novelty.

The Examiner also again relies on In re Curtis and Noelle v. Lederman to support her assertion that the written description requirement has not been met. The portion of Curtis quoted by the Examiner makes reference to the insufficiency of the disclosure of a single species to support a genus. As noted above, far more than a single species is disclosed here and thus the relevance of Curtis is not seen. In citing Noelle v. Lederman, the Examiner states that the court pointed out that a generic claim to anti-CD40CR Mabs lacked written description because there was no description of anti-human or other species Mabs and no description of human CD40CR antigen. Basis for the Examiner's reliance on Noelle v. Lederman is not seen, given that the subject specification is replete with examples of known agents that can be used in the practice of the presently claimed method, and that one skilled in the art would have recognized the existence of many others.

---

<sup>1</sup> The Examiner is once again reminded that the claims of Lilly were drawn to a product (cDNA), not to a method. The product was a vertebrate insulin cDNA or mammalian insulin cDNA. The court in Lilly found these recitations provided an inadequate description of the claimed genus because they did not distinguish the claimed genus from others, except by function. This is clearly a very different situation than that which exists here.

Appl. No. 10/074,250  
July 10, 2006

In view of the above, reconsideration and withdrawal of the rejection are requested.

Claim 1 stands rejected under 35 USC 112, first paragraph, as allegedly being non-enabled. Withdrawal of the rejection is submitted to be in order for the reasons that follow.

In rejecting claim 1, the Examiner states that "[t]hese recitations, 'an agent that inhibits vascular proliferation' and 'a chemotherapeutic agent', are seen to be merely functional language." The Examiner contends that the instant specification fails to provide information that would allow one skilled in the art to fully practice the instant invention without undue experimentation. Respectfully, these comments overlook the fact that the subject disclosure includes numerous examples of agents appropriate for use in the instant invention, as well as methods of identifying yet further suitable agents.

Applicants have previously drawn the Examiner's attention to the court's decision in In re Angstadt and Griffin, 190 USPQ 214 (CCPA 1976) which is an enablement case that is particularly relevant to the present rejection of claim 1. No responsive comment from the Examiner is found in the present Action. Accordingly, Applicants again point out that, in Angstadt, the court acknowledged that Appellants had not disclosed every catalyst that would work in the claimed chemical process and addressed the question of whether, in an unpredictable art, the enablement requirement of 35 USC 112, first paragraph, requires disclosure of every species encompassed by the claims. The court found that there was not such requirement, pointing out that:

"such a requirement would force an inventor seeking adequate patent protection to carry out a prohibitive number of actual experiments. This would tend to discourage inventors from filing patent applications in an unpredictable area since the patent claims would have to be limited to those embodiments which are expressly disclosed."

NIKLASON et al  
Appl. No. 10/074,250  
July 10, 2006

The court concluded that, having decided that disclosure of every species encompassed by the claims is not required, even an unpredictable art, each case must be determined on its own facts. In Angstadt, the court found that Appellants' disclosure of a list of catalysts and details of how to make and use them to be sufficient. The court pointed out that the experimentation required to determine which species would work would not be undue and would certainly not "require ingenuity beyond that to be expected of one of ordinary skill in the art" (citing Fields v. Conover, 170 USPQ 276, 279 (CCPA 1971)).

The facts in Angstadt are similar to those here. Here, the disclosure at pages 7-10 includes numerous types of agents suitable for use in the invention, as well as numerous examples of specific agents and still others would have been known to the skilled reader. Also included are citations for publications teaching additional specific agents (which publications are incorporated by reference at page 28). In addition, the application includes at pages 10-12 examples of methods that can be used to screen for suitable agents. Clearly, given the holding in Angstadt, nothing more should be required of Applicants.

The Examiner again refers to the claims being functional at the point of novelty. If the claim reads "A method of treating or inhibiting progression of cerebral vasospasm that follows SAH comprising administering to a patient in need of such treatment or inhibition an amount of an agent that effects said treatment or inhibition", the Examiner would have a point. Clearly such is not the case here. Rather, because Applicants have come to appreciate (and disclose in the subject application) the mechanism underlying cerebral vasospasm progression following SAH, Applicants are able to teach, and have recited in claim 1, agents suitable for use in treating or inhibiting such progression.

Reconsideration is requested.

Appl. No. 10/074,250  
July 10, 2006

Claims 1, 10 and 11 stand rejected under 35 USC 102(b) as allegedly being anticipated by Black. The rejection is traversed.

The Examiner contends that Black discloses that well-known neuropharmaceutical agents, such as chemotherapeutic agents, are useful in treating abnormal brain tissue, including SAH. Respectfully, in so contending it is clear that the Examiner has misinterpreted the reference.

Black relates to "a method for selectively opening abnormal brain tissue capillaries ... to allow selective passage of ... neuropharmaceutical agents into abnormal tissue." That is, Black describes a method to induce permeability, or "leakiness", in abnormal brain capillaries (which are roughly 10 microns in diameter). The induced "leakiness" allows the passage of therapeutic molecules into the surrounding brain tissue.

By contrast, the presently claimed method relates to the treatment or inhibition of cerebral vasospasm, which is a disease of small- to medium-sized arteries, several mm in diameter. The specific syndrome of vasospasm following SAH was poorly understood. Applicants have realized (and disclose in the subject application) that this syndrome is caused by thickening of the wall of the artery in response to factors released during SAH. As a result of this realization, Applicants were able to teach in the instant application how to treat this syndrome, by blocking the growth and proliferation that occurs in the arterial wall. Thus, the claimed method, in contrast to Black, has nothing to do with capillaries, or with inducing permeability within capillaries, or with delivering drugs to injured brain tissue. Likewise, Black is unrelated to inhibiting cerebral vasospasm that results from SAH. This is underscored by the fact that figures and examples contained in Black speak to the deliver of molecules across the walls of capillary vessels.

NIKLASON et al  
Appl. No. 10/074,250  
July 10, 2006

In Black, according to the abstract and specification, "abnormal brain tissue capillaries" are "opened" in order to allow "selective passage of both low and high molecular weight neuropharmaceutical agents into the abnormal brain tissues". The clinical problem addressed by Black is the "passage of drugs into the abnormal brain tissue". Black provides a method to increase the permeability of the "abnormal brain tissue capillaries", such that drugs can pass through the wall of the capillaries and into the brain tissue. This method involves opening the abnormal brain tissue capillaries by infusing bradykinin or a bradykinin analog into the carotid artery of the mammal. The bradykinin or bradykinin analog is infused in an amount sufficient to selectively open the abnormal brain tissue capillaries to allow passage of neuropharmaceutical agents, including high molecular weight agents, into the abnormal brain tissue without opening the normal brain capillaries to passage of the neuropharmaceutical agent. The method is indicated to be applicable to the treatment of brain tumors, abnormal tissues resulting from multiple sclerosis, ischemia and cerebral abscess. The method is also indicated to be applicable to brain tissue that is inflamed, infected or degenerated due to any number of different diseases. Examples of specific types of abnormal brain tissue are indicated to include, in addition to SAH, gliomas, metastatic brain tumors, head injury, meningitis, brain abscess and multiple sclerosis.

In the paragraph bridging columns 4 and 5 of Black, its stated:

Any of the well known neuropharmaceutical agents may be administered in accordance with the present invention. Low molecular weight (100-20,000) as well as high molecular weight (about 20,000 to 70,000) neuropharmaceutical agents may be used. In addition to neuropharmaceutical agents, diagnostic agents may be used including imaging or contrast agents. Exemplary diagnostic agents include substances that are radioactively labelled such as <sup>99</sup>Tc glucoheptonate, gallium-EDTA, ferrous magnetic or iodinated contrast agents. Exemplary neuropharmaceutical agents include antibiotics, adrenergic agents, anticonvulsants, nucleotide analogs, chemotherapeutic agents, anti-trauma agents and other

NIKLASON et al  
Appl. No. 10/074,250  
July 10, 2006

classes of agents used to treat or prevent neurological disorders. Specific neuropharmaceutical agents which can be administered into abnormal brain tissue in accordance with the present invention include cisplatin, carboplatin, tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ), methotrexate, 5-FU, amphotericin, immunotoxins, boron compounds, monoclonal antibodies and cytokines, such as interferons, interleukins, transforming growth factors, oligonucleotides.

Black in no way teaches or suggests that any or all of these neuropharmaceutical agents could be used to treat any or all of the abnormal brain tissues referenced above. The point of this portion of Black is that infusion of bradykinin or a bradykinin analog in accordance with the method taught allows passage of whatever neuropharmaceutical agent might be necessary to treat the abnormal tissue – e.g., passage of a chemotherapeutic agent to treat a glioma or metastatic brain tumor or passage of an antibiotic to treat brain tissue that is infected.

Absolutely nothing in Black teaches administering a chemotherapeutic agent to treat SAH, as the Examiner contends. Accordingly, reconsideration is requested.

This application is submitted to be in condition for allowance and a Notice to that effect is requested.

Respectfully submitted,

NIXON & VANDERHYE P.C.
